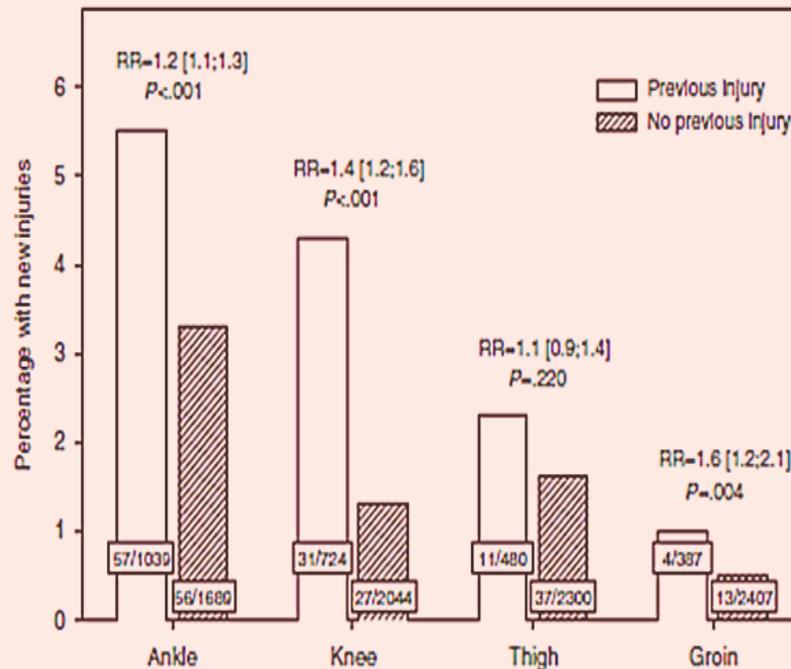

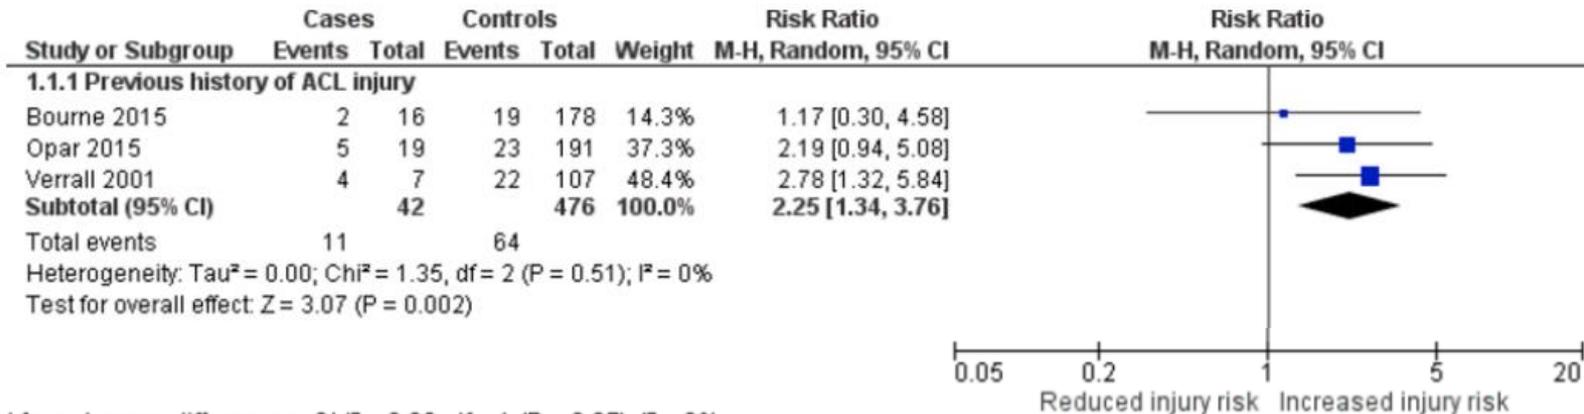

Figure 1. Risk of new injuries for players with previous injuries for each of the 4 specific regions. Each limb has been treated separately in this analysis. RR, relative risk.

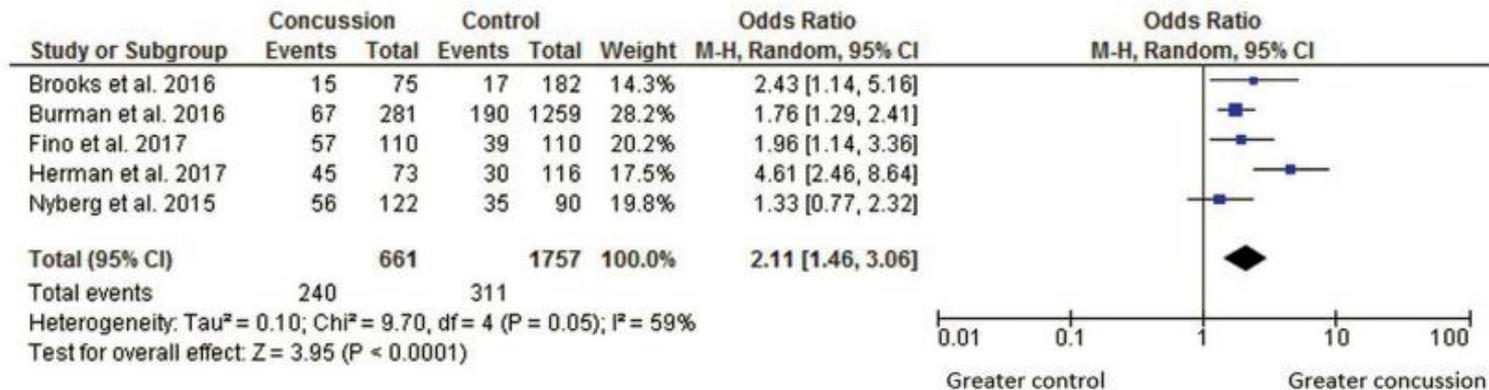

Steffen et al. (2008)

LESIÓN PREVIA

Test for subgroup differences: Chi² = 0.82, df = 1 (P = 0.37), I² = 0%

Athletes who had a concussion had 2 times greater odds of sustaining a MSK injury than athletes without concussion. Athletes who had an ACL injury had 2 times greater odds of sustaining a subsequent hamstring injury.

LESIÓN PREVIA

CUESTIONARIO AUTORREPORTE

INSTRUCCIONES: Te pedimos que completes este registro sobre las lesiones padecidas la TEMPORADA PASADA.

¿Cuántas lesiones padeciste la temporada pasada?
Rellena una ficha por cada una de las lesiones padecidas.

Total	10	116

Association of Specialization and Training Volume With Injury History in Youth Athletes

2011 youth athletes (12-18 years) completed a questionnaire regarding their specialization status, yearly & weekly sport participation volume, injury history

Result 1

Highly specialized athletes were more likely to report a previous injury of any kind (+59%) or an overuse injury (+45%) in the previous year

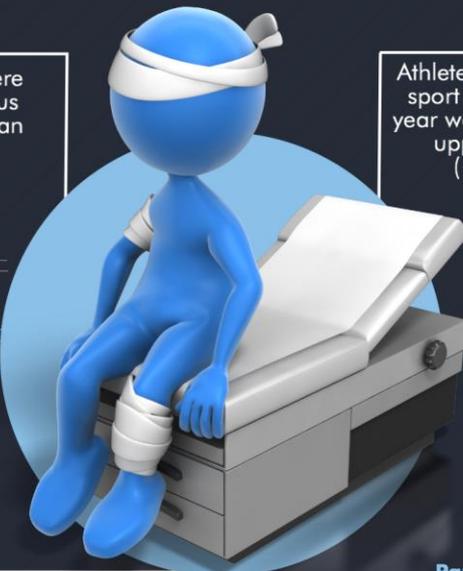

Result 2

Athletes who played their primary sport more than 8 months of the year were more likely to report an upper extremity overuse injury (+68%) or a lower extremity overuse injury (+66%)

Result 3

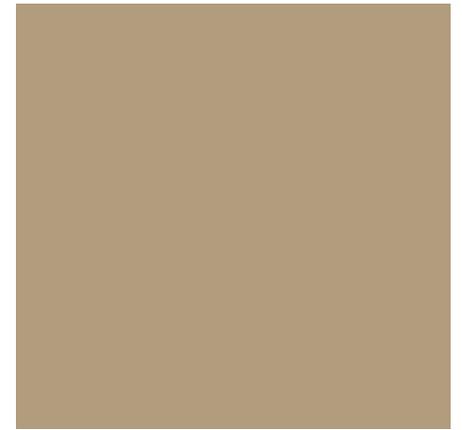

Athletes who participated in their primary sport for more hours per week than their age were more likely to report an injury of any type (+34%) in the previous year

Parents and youth athletes should be aware of the risks of specialization and excessive sport volume to maximize safe sport participation

25. Pierdo oportunidades por no decidirme pronto	0	1	2	3
26. Me siento descansado	0	1	2	3
27. Soy una persona tranquila, serena y sosegada	0	1	2	3
28. Veo que las dificultades se amontonan y no puedo con ellas	0	1	2	3
29. Me preocupo demasiado por cosas sin importancia	0	1	2	3
30. Soy feliz	0	1	2	3
31. Suelo tomar las cosas demasiado seriamente	0	1	2	3
32. Me falta confianza en mí mismo	0	1	2	3
33. Me siento seguro	0	1	2	3
34. Evito enfrentarme a las crisis o dificultades	0	1	2	3
35. Me siento triste (melancólico)	0	1	2	3
36. Estoy satisfecho	0	1	2	3
37. Me rondan y molestan pensamientos sin importancia	0	1	2	3
38. Me afectan tanto los desengaños, que no puedo olvidarlos	0	1	2	3
39. Soy una persona estable	0	1	2	3
40. Cuando pienso sobre asuntos y preocupaciones actuales, me pongo tenso y agitado.	0	1	2	3

STAI

Athletes who reported preseason anxiety symptoms had a significantly higher injury incidence rate in the prospective season compared with those who reported no preseason anxiety symptoms.

+ VARIABLES NEUROMUSCULARES

FACTORES DE RIESGO DE LESIÓN

FUERZA EXTREMIDAD INFERIOR

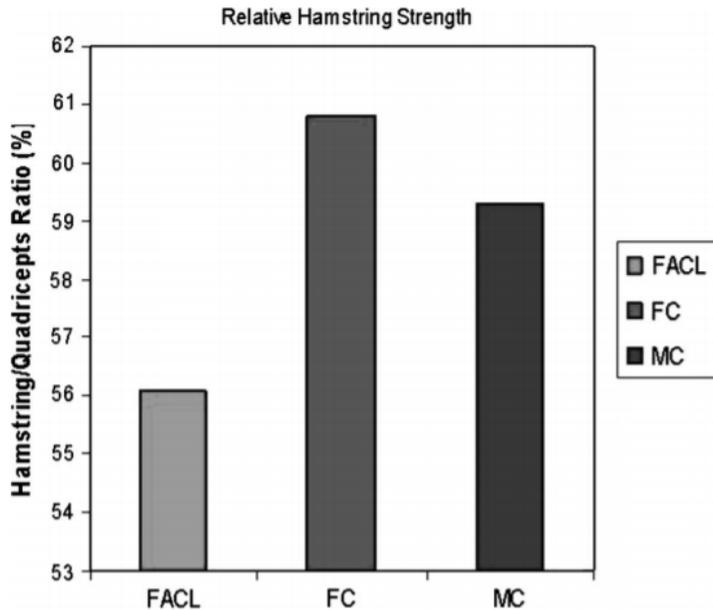

FIGURE 3. Median hamstrings to quadriceps ratio for each of the matched comparison groups. FACL, female ACL injured; FC, female control; MC, male control.

Myer et al. (2009)

↓ fuerza excéntrica isquios (<45° flexión rodilla)

↑ fuerza concéntrica cuádriceps (>60° flexión rodilla)

Ayala et al. (2016)

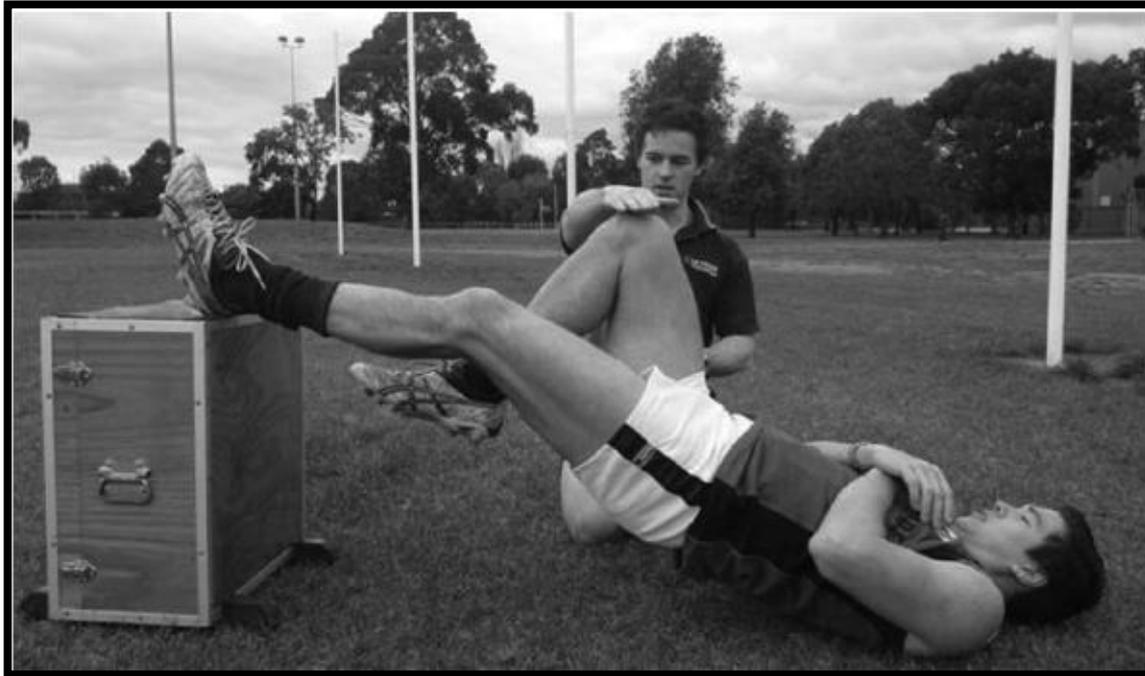

The findings of the current study also highlight that poor reciprocal hamstring-to-quadriceps ratios, calculated using angle specific torque values close to full extension, are present in the identification of players at high risk of HSI.

Ayala et al. (2019)

FUERZA EXTREMIDAD INFERIOR

FIELD-BASED HAMSTRING STRENGTH TESTS → Single leg hamstring bridge (SLHB)

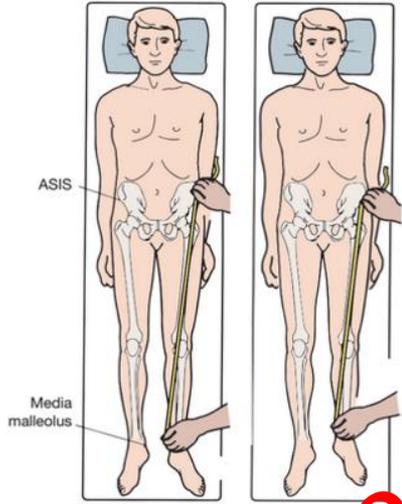

As many repetitions as possible

This assessment could also be considered a test of muscular endurance as opposed to strength, and places a greater emphasis on the concentric function of the hamstrings.

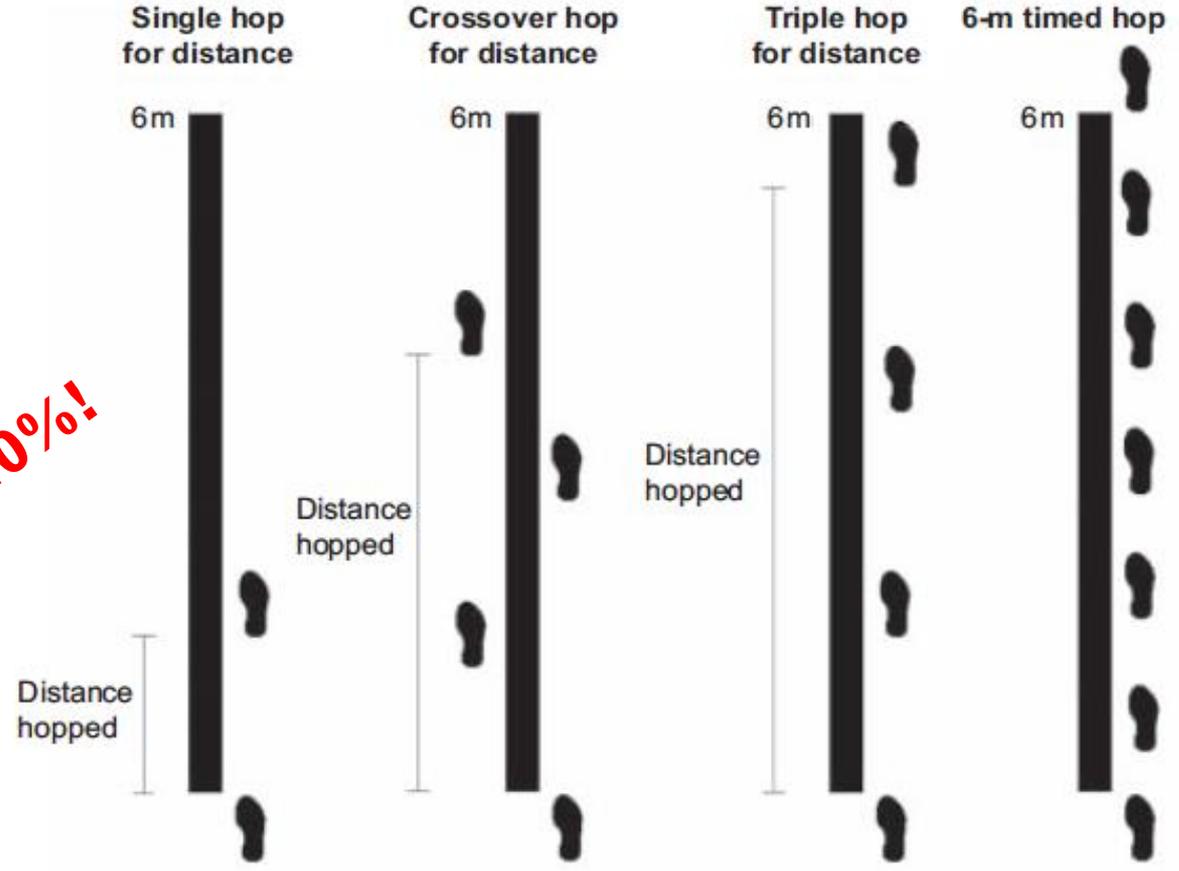

SLHB scores ≤ 20 reps increases risk of hamstring strain.

FUERZA EXTREMIDAD INFERIOR

--	--	--	--	--	--

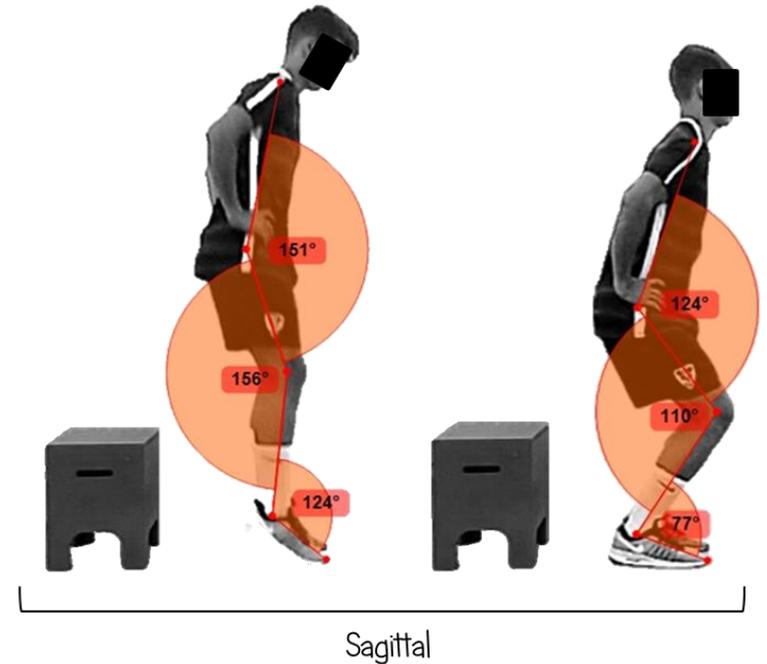

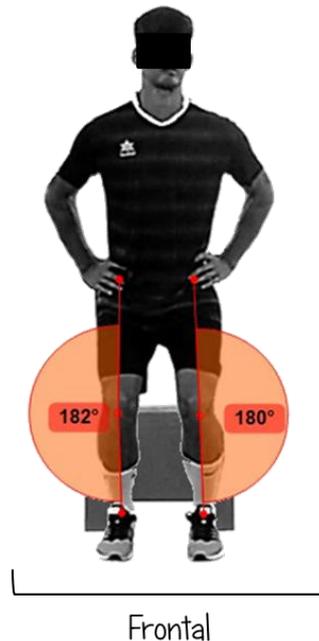

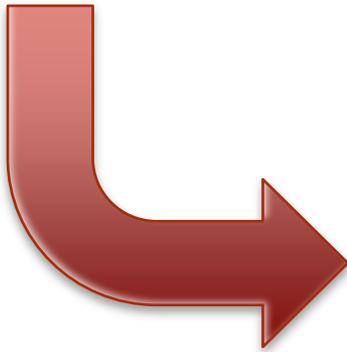

Figure 2 Tuck Jump Assessment: Six common mistakes that clinicians should aim to correct for their athletes while they perform the tuck jump exercise: (1) athletes display unwanted medial knee collapse, (2) athletes do not achieve the desired knees parallel position at top of flight, (3) athletes do not displayed synchronized lower limb positions during flight, (4) athletes land with their feet too close together, (5) athletes land in undesirable staggered position, and (6) athletes do not land with both feet at the same time.

PATRONES DE MOVIMIENTO

Highlights

- Subjective assessment of DVJ and tuck jump in youth athletes was rater dependent.
- Poor subjective knee control associated with smaller knee separation distance in DVJ.
- Subjective assessment of knee control should be used in tandem with 2D analysis.

ESTABILIDAD DINÁMICA

TABLE 6. Adjusted odds ratios for potential lower extremity injury risk factors among high school basketball players.

Risk Factor	Category	LE Injury AOR [‡] (95% CI)
All players		
Normalized composite right reach distance*	≤94.0%	3.0 (1.5, 6.1)
Anterior reach distance difference [†]	≥4 cm	2.7 (1.4, 5.3)
Girls		
Normalized composite right reach distance*	≤94.0%	6.5 (2.4, 17.5)
Boys		
Anterior reach distance difference [†]	≥4 cm	3.0 (1.1, 7.7)

* Reach distance is reach distance divided by limb length multiplied by 100. Right reach done by standing on left limb and reaching with the right limb.

[†]Difference between right and left anterior reach distances.

[‡] Adjusted odds ratio for gender, grade, previous injury, participation in a neuromuscular training program since initial measurement, and lower extremity tape/brace use.

Baloncesto

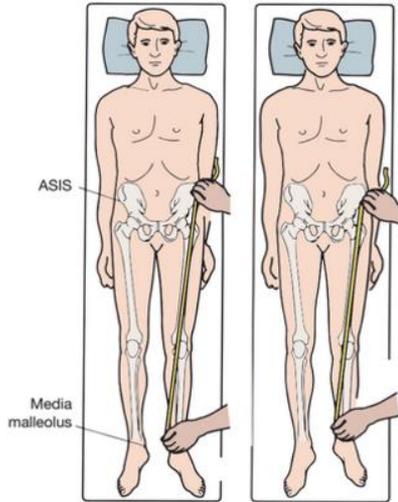

TABLE 2. Association between CS and asymmetry and injury in collegiate athletes during competitive season.

YBT Variable	OR	95% CI	P value
ANT asymmetry (>4-cm reference)	2.20	1.09–4.46	0.03
PM asymmetry (>4-cm reference)	1.15	0.58–2.30	0.69
PL asymmetry (>4-cm reference)	0.57	0.28–1.14	0.11
CS	1.00	0.95–1.04	0.69

Anterior **asymmetry >4 cm** was significantly associated with noncontact injury.

ESTABILIDAD DINÁMICA

Anterior

Posteromedial

Posterolateral

To express **reach distance** as a **percentage of limb length**, the **normalized value** was calculated as reach distance divided by limb length then multiplied by 100.

$$[\text{Distancia alcanzada} / \text{longitud pierna}] \times 100$$

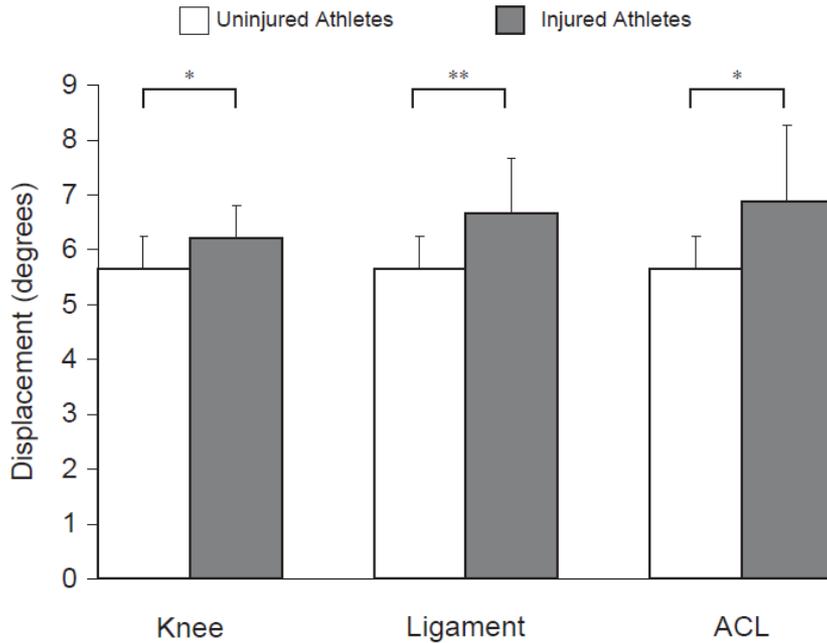

Composite reach distance was the sum of the 3 reach directions divided by 3 times limb length, then multiplied by 100

$$[(\text{Anterior} + \text{Postero-Medial} + \text{Postero-Lateral}) / (3 \times \text{longitud pierna})] \times 100$$
