

CORE EVIDENCE-BASED PRACTICE COMPETENCIES AND LEARNING OUTCOMES FOR EUROPEAN NURSES: CONSENSUS STATEMENTS

Running head: Evidence-based practice competencies for European nurses

Abstract

Background and/or rationale: Consensus on evidence-based practice (EBP) competencies and associated learning outcomes for registered nurses has not yet been achieved in the European context.

Aims: To establish a set of core EBP competencies for nurses and the most important EBP learning outcomes encompassing attitudes, knowledge, and skills dimensions for implementation into nursing education in European countries.

Methods: A multi-phase modified Delphi survey was conducted: Phase 1 - a literature review; Phase 2 - a two-round consensus of experts; Phase 3 - a Delphi survey. Experts from six European countries participated.

Results/findings: In Phase 1, 88 records were selected and 835 statements extracted, which were grouped according to the seven steps of EBP. After removing 157 duplicates, the remaining competencies (n = 678) were evaluated in Phase 2. Then, a two-round expert consensus was reached, with 24 competencies and 120 learning outcomes identified and divided into affective, cognitive, and skills domains. In Phase 3, based on a Delphi survey expert consensus, all evaluated statements were included in a final set of competencies and learning outcomes. Only two learning outcomes were recommended for allocation to a different domain, four were reformulated as suggested, with no further changes to the others.

Linking evidence to action:

- The set of EBP competencies and learning outcomes can guide nurse educators, managers and EBP stakeholders in the development of contents that incorporate EBP knowledge, skills, and attitudes into education programs.

- Prioritizing the EBP competencies and learning outcomes that are most necessary, and adapting them to every context, will provide healthcare organizations with guidelines for enhancing the continuing education of nurses.

- These results could facilitate the development of effective tools for assessing nursing students' and nurses' perception of competencies required for EBP processes.

Keywords: Evidence-based practice, Competency, Consensus, Delphi survey, Learning outcome, Learning, Nursing education, Nurse

Background and significance of the study

A thorough integration of the best scientific evidence into daily practice is key to effective improvement of quality of care and patient outcomes (Saunders, Gallagher-Ford, & Vehviläinen-Julkunen, 2019). The World Health Organization, therefore, states that it is imperative for countries in the WHO European Region to consider the benefits of evidence-based practice (EBP) and to focus on continuous improvement in quality of care. Nurses, as the largest group of healthcare professionals, play a key role in providing effective, safe and evidence-based care, which requires the translation of research results into EBP (World Health Organization, 2017). To ensure safe and quality nursing practice, the acquisition of EBP competency is essential (Orta et al., 2016); however, most nurses are not prepared for EBP (Oh et al., 2010; Patelarou et al., 2017; Saunders, & Vehviläinen-Julkunen, 2016), which manifests itself as insufficient knowledge, values, and competencies for understanding and use of EBP

(Skela-Savič et al., 2017). Although they are familiar with the concept of EBP, have a positive attitude towards it, and, moreover, believe that EBP may improve the quality of care and patient outcomes, nurses perceive their own EBP skills to be inadequate and do not feel qualified to apply EBP in their work (Melnyk et al., 2018; Skela-Savič et al., 2016; Zeleníková et al., 2016).

Expectations of improvement in EBP quality generate new professional competencies that allow healthcare professionals and organizations to clarify performance expectations regarding EBP and succinctly outline the expected competencies for successful application of best evidence to daily care (Saunders, Gallagher-Ford, & Vehviläinen-Julkunen, 2019). As the education of nurses has developed from hospital-based training to a competence-based curriculum, set core competencies have become crucial for effective nursing training (Reeves, Fox, & Hodges, 2009). The 2015 Competency Framework, based on the European directive 2013/55/EU, recognized implementation of scientific findings into EBP as a central competency of the undergraduate education of nurses in the European Union (European Federation of Nurses Associations, 2015). In addition, the European Federation of Nurses Associations (EFN, 2014) defined four categories of nursing care providers in a document entitled “EFN Matrix on the Four Categories of the Nursing Care Continuum”, which also introduced EBP tasks at the level of Specialist Nurse and Advanced Practice Nurse. EBP has also been recognized as a central competency by the Quality and Safety Education for Nurses (QSEN) project, a global nursing initiative whose purpose is to meet the challenge of preparing future nurses with the knowledge, skills, and attitudes necessary to continuously improve the quality and safety of the healthcare system they work in. Together with representatives of 11 other professional organizations, the QSEN Institute has defined quality and safety competencies for nursing, and has proposed targets for the knowledge, skills, and attitudes to be developed in nursing graduate programs for each competency. Besides competencies in patient-centred care, teamwork and collaboration, quality improvement, safety, and informatics, they also defined competencies for EBP (Cronenwett et al, 2007; QSEN, 2020).

Conceptual framework

There is no single definition of the concept of competency. For the purpose of this study, we consider competency as “the capacity of nurses to integrate cognitive, affective and psychomotor abilities in nursing care provision” (Miller, Hoggan, Pringle, & West, 1988). Similarly, Leung, Trevena and Waters (2016) view competency as the combination of complex attributes of knowledge, skills, and attitudes with the ability to make professional judgements and to perform intelligently in specific situations. In the field of education, the relationship between competencies and learning outcomes has been widely discussed. It has been pointed out, that competencies with a narrow focus can be regarded as learning outcomes (Kennedy, Hyland, & Ryan, 2009). These support the competencies, are at a greater level of detail, and form the basis of both learning and assessment (Oliver et al., 2008). To ensure clarity of meaning, it is, therefore, recommended to translate competencies into learning outcomes - that is, to express the required competency in terms of students’ or professionals’ accomplishment of specific learning outcomes (Kennedy, Hyland, & Ryan, 2009).

Generally, EBP competencies arise from key EBP principles and steps that are universal (Saunders, Gallagher-Ford, & Vehviläinen-Julkunen, 2019). Laibhen-Parkes (2014) suggest that EBP competency is the ability to ask clinically relevant questions for the purposes of acquiring, appraising, applying, and assessing multiple sources of knowledge within the context of caring for a particular patient, group, or community. Over the last decade, several national EBP competency frameworks have emerged, with the USA as a leading pioneer. Stevens (2009)

1
2
3 reported a national consensus on essential competencies for EBP in nursing, reached through a
4 process involving a panel of experts. These original competency statements were classified
5 across the undergraduate, masters, and doctoral levels of nursing preparation and organized into
6 the five stages of knowledge transformation according to the ACE Star Model of Knowledge
7 Transformation (Stevens, 2004). More recently, Melnyk et al. (2014) developed a new set of
8 EBP competencies for practicing registered nurses and advanced practice nurses in real-world
9 healthcare settings. These competencies are more focused on developing practice capabilities
10 that nurses must acquire to implement EBP. The results served as a starting point for
11 establishing consensus on the key content of the essential EBP competencies for registered and
12 advanced practice nurses among Finnish nurse panellists (Saunders, Gallagher-Ford, &
13 Vehviläinen-Julkunen, 2019). A study by Australian authors Leung, Trevena and Waters (2016)
14 designed a competency framework for measuring EBP knowledge and skills based on the five-
15 step EBP model. Another set of core EBP competencies for healthcare professionals was
16 identified using a Delphi survey, following a systematic literature review (Albarqouni et al.,
17 2018).

18
19
20
21 Although previous work can be a useful starting point, in European healthcare, EBP is rarely
22 an integral part of patient care or nursing education curricula (Ruzafa-Martínez, 2019).
23 Therefore, the main and most urgent task remains working effectively to develop and provide
24 professional education that facilitates the implementation of EBP (Lehane et al., 2019).
25 Agreement on EBP competencies and associated learning outcomes for registered nurses has
26 not yet been achieved in the European context. Stakeholders in academic and clinical settings
27 need a properly constructed set of competencies and learning outcomes outlining what nursing
28 students and nurses should know, understand, and be able to do (and to what degree of
29 proficiency), using language and contexts that indicate the level at which they will be assessed.
30 The present proposal focuses on providing these outputs through the collaboration of six
31 European higher education institutions participating in a project funded by the European
32 Erasmus+ Programme (Ruzafa-Martínez, 2019).

33 34 35 36 **Purpose/aim**

37
38 The aim was to establish a set of core EBP competencies for nurses and the most important
39 EBP learning outcomes encompassing attitudes, knowledge, and skills dimensions for
40 implementation into nursing education in European countries, including undergraduate,
41 graduate, and continuing education programs.

42 43 44 **Methods**

45 **Design**

46 A multi-phase modified Delphi survey. Phase 1 - a literature review on EBP competencies;
47 Phase 2 - two-round expert consensus to prioritize the most essential EBP competencies and
48 learning outcomes; and Phase 3 - a Delphi survey to establish a final set of core EBP
49 competencies and learning outcomes for nurses.

50 51 **Phase 1: a literature review on EBP competencies**

52 In Phase 1 (January-February 2019), a literature review was conducted to identify and analyze
53 studies focusing on EBP competencies for nurses. Research teams from the Czech Republic,
54 Greece, Italy, Poland, Slovenia, and Spain participated in the review. Studies were identified
55 using a search strategy and predefined criteria in the bibliographic databases CINAHL Plus
56 with Full Text, SpringerLink, Cochrane Library, ProQuest, ScienceDirect, Web of Science,
57 SCOPUS, EBSCO, PubMed, EMBASE, and PsycINFO, as well as in national databases in all
58
59
60

1
2
3 the participating countries. Each database was searched by two researchers from the different
4 countries. For the present study, a *Data Extraction Protocol* was created (Supplement 1).
5 Using content analysis (Bengtsson, 2016), two researchers (JD and DJ) identified EBP
6 competencies for nurses in the studies and grouped them according to the seven steps of EBP
7 (Melnyk, & Fineout-Overholt, 2015). Subsequently, the set of competencies was revised (MRM
8 and AJRM) and duplicate and irrelevant items were excluded.
9

10 11 **Phase 2: two-round expert consensus to prioritize the most essential EBP competencies** 12 **and learning outcomes**

13
14 In the first round (April 2019), the project research team, consisting of two researchers from
15 each participating country (i.e. 12 in total), analyzed and assessed EBP competency statements,
16 rating the adequacy of all items to their EBP steps, from 0 points (completely inadequate) to
17 100 points (completely adequate). They also evaluated the clarity and intelligibility of the
18 wording of competencies. An EBP statement was maintained in the selected domain when a
19 predefined consensus level of at least 70% of the experts was achieved. The assessed statements
20 were revised and some of the items were reworded and reassigned to other steps of EBP, as
21 necessary.
22

23
24 In the second round (May-June 2019), the research team reviewed the selected statements and
25 allocated them to the corresponding affective, cognitive, skills, or practical domains. If
26 necessary, statements were rewritten or new ones were added. According to the conceptual
27 framework adopted in the study, competencies were considered to be statements of a general
28 nature consisting of a subset of learning outcomes, as defined by Kennedy, Hyland and Ryan
29 (2009). A qualitative evaluation of the results allowed identification of two levels of specificity
30 in the statements selected. Some were written as practical competencies or behavioral actions
31 coinciding with statements allocated to the practical domain, while the more specific statements
32 were assigned to the other domains (affective, cognitive, and skills) and deemed learning
33 outcomes. Consequently, the research team agreed to consider statements from the practical
34 domain (24 items in total) as specific competencies. The remaining statements were deemed
35 learning outcomes, which were assessed in the next phase.
36
37
38
39

40 **Phase 3: a Delphi survey to establish a final set of core EBP competencies and learning** 41 **outcomes for nurses**

42
43 The set of core EBP competencies for nurses, together with learning outcomes selected during
44 Phase 2 were assessed using a Delphi survey (McPherson et al., 2018) by a selection of experts
45 from all the participating countries. Experts for the survey panel were designated in accordance
46 with the following predefined criteria: healthcare professionals nationally renowned for EBP or
47 the development of instruments, from different practice profiles and geographical areas in
48 Europe. Members of the research team did not take part in the Delphi survey. Specific
49 instructions were sent to each expert, including an explanation of the aim of the study and a
50 description of Phases 1 and 2, which had generated the initial set of competencies and learning
51 outcomes. Survey collection was conducted in the period September-October 2019. Learning
52 outcomes were assessed on a Likert scale ranging from 0 points (completely irrelevant) to 5
53 points (completely relevant). The experts also evaluated the clarity and intelligibility of the
54 wording of competencies and learning outcomes and their adequacy to their domains and EBP
55 steps. Based on the panel's assessment, the competencies and learning outcomes were revised
56 by two researchers (JD and DJ). Learning outcomes with an average score of less than four
57 points were excluded.
58
59
60

Ethical issues

The study complied with the Declaration of Helsinki. Participants were informed that their consent was assumed if they responded to the survey. Anonymity and confidentiality were assured regarding use of data.

Data analyses

A content analysis was performed in order to detect and introduce new proposals or reformulations of statements. Descriptive statistics were conducted (mean, standard deviation, absolute frequency, relative frequency), using SPSS Statistics version 26.0 (IBM Corp., Armonk, NY, USA).

Results/findings

Initially, a literature review was conducted (Supplement 2). A total of 21,039 records were found. Of these, 3,654 duplicates were excluded. Subsequently, 15,356 records were excluded by title, 1,727 records were excluded by abstract, and 214 were excluded by full-text screening. The basic set of documents to be analyzed comprised 88 records from 1998 to 2018, including EBP competency reviews and consensus studies for nurses and allied healthcare professionals (Supplement 3). Many of the statements were constructed on the basis of previous works. Based on content analysis of the basic set, EBP competencies for nurses were identified ($n = 835$). After statements were grouped into the seven EBP steps, duplicate and irrelevant statements were excluded ($n = 157$) as shown in Supplement 4. Most statements were placed in Step 3 - "*Critically appraise the evidence that has been collected for its validity, reliability, and applicability, then synthesize that evidence*" (25.6%), and Step 2 - "*Search for and collect the most relevant and best evidence to answer the clinical question*" (20.3%). The lowest percentage of statements was in Step 6 - "*Disseminate the outcomes of the EBP decision or change*". Regarding excluded statements, 29.3% were placed in Step 2 and 15.2% in Step 1.

The remaining competencies ($n = 678$) were evaluated in the first round (Phase 2), and based on the scores of adequacy to each EBP step, 188 statements were retained (Supplement 4). In the second round (Phase 2), statements were allocated to the cognitive, affective, skills, or practical domains; no agreement was reached on 45 statements, one statement was added to Step 6, and 51 statements were reformulated. This second subset of statements ($n=144$) was subjected to qualitative analysis and, according to the conceptual framework adopted in the study, a set of core EBP competencies for nurses ($n = 24$) and learning outcomes ($n = 120$) was generated. Twenty-three of the selected competencies are part of the EBP competency framework by Melnyk et al. (2014). Competencies 5, 6, 7, 13, 15 and 23 were minimally reformulated. Competency 16 was considered similar to competency 7 and eliminated. A new competency was added in Step 5 - "*Interpret obtained outcomes after the evaluation of an evidence-based changed practice*".

Finally, in Phase 3, the set of core EBP competencies for nurses and learning outcomes was submitted for evaluation to 30 members of an international panel of experts (Supplement 5) conducting a Delphi survey. Consensus was reached in the first round, with mean scores of all learning outcomes of four or higher (range 4.0 - 4.9), and the final set of core EBP competencies for nurses and relevant learning outcomes was established without changing the number from the previous phase. Minimal changes were suggested by the experts. In Step 3, two statements from the affective domain were reassigned, one to the cognitive domain, and the other to the skills domain. Four statements were reformulated. Overall, the set included 24 competencies and 120 learning outcomes (Supplement 6). The distribution of competencies and learning outcomes is quite balanced, with the smallest number of statements in Step 1 - "*Ask the burning*

1
2
3 *clinical question*”, and the greatest number of statements in Step 4 - *“Integrate the evidence”*.
4 In the initial set of statements, Steps 2 - *“Search”* and 3 - *“Critical appraisal”* had the highest
5 reduction in statements (around 10%) because much of them were redundant and received a
6 low rating. Conversely, This meant that statements in Steps 5 - *“Evaluate outcomes”* and 6 -
7 *“Disseminate”* increased the relative proportion over the total by approximately 6-8% in the
8 final set. The proportion of learning outcomes was 18.3% in the affective domain, 29.1% in
9 the cognitive domain, and more than half (52.5%) in the skills domain (Supplement 4).
10
11

12 Discussion

13 Nursing faculties and healthcare systems aim to ensure that healthcare professionals are
14 competent in their clinical practice, including EBP, as recommended by
15 international organizations and institutions (European Federation of Nurses Associations,
16 2015; World Health Organization, 2017; Cronenwett et al., 2007; QSEN, 2020). This has led
17 to an increased interest in establishing an EBP competency framework for nurses, mainly in
18 the USA (Stevens, 2009; Melnyk et al., 2014) and Australia (Leung, Trevena, & Waters,
19 2016). Based on an updated literature review and consensus of experts from the Czech
20 Republic, Greece, Italy, Poland, Slovenia, and Spain, 24 EBP competencies and 120
21 learning outcomes for general nurses and advanced nurses were identified. This is the first
22 study to establish a set of EBP competencies and learning outcomes within the European
23 nursing context.
24
25

26
27 The proposed framework has several advantages over existing ones. Our proposed
28 competency framework is supported by a conceptual background that understands
29 competency (Laibhen-Parkes, 2014) as a cluster of related attitudes, knowledge, and skills
30 that have a major impact on one’s job (role or responsibilities), and are demonstrated when a
31 person is able to perform certain tasks within a defined context of professional practice. The
32 reviewed statements showed two levels of specificity that, according to educational theories
33 (Kennedy, Hyland, & Ryan, 2009), permitted us to separate specific competencies and
34 learning outcomes grouped into affective, cognitive, and skills domains. Consensus was
35 achieved regarding competency statements using, with minor modifications, the EBP
36 competency framework by Melnyk et al. (2014) as the basis, as previously done in a
37 Finnish context (Saunders, Gallagher-Ford, & Vehviläinen-Julkunen, 2019). The seven EBP
38 steps as defined by Melnyk and Fineout-Overholt (2015) allowed allocation of
39 competencies and learning outcomes in a systematic way, following the EBP process,
40 with the incorporation of two new steps compared to previous EBP competency frameworks
41 based on the generic five-step EBP model (Straus, et al., 2011; Leung, Trevena, & Waters,
42 2016; Albarqouni, Hoffmann, & Glasziou, 2018): Step 0 - *“Cultivate a spirit of inquiry
43 within an EBP culture and environment”*, and Step 6 - *“Disseminate the outcomes of the
44 EBP decision or change”*.
45
46
47
48

49 Our framework incorporates 120 learning outcomes classified into affective, cognitive,
50 and skills domains, and is associated with the most appropriate competencies and the
51 seven-step EBP process. Previous frameworks have used the same three domains (Cronenwett
52 et al., 2007; QSEN, 2020) but in a less detailed manner. In our proposal, the distribution of
53 competencies and learning outcomes is very balanced, an uncommon feature. In the
54 aforementioned competency frameworks, the acquire and appraise steps show a greater
55 concentration of statements (Leung, Trevena, & Waters, 2016; Albarqouni, Hoffmann, &
56 Glasziou, 2018), and are usually overrepresented in educational strategies (Albarqouni,
57 Hoffmann, & Glasziou, 2018). Our proposal tries to resolve this anomaly, with special
58 attention paid to developing learning outcomes in the implementation, evaluation, and
59 dissemination steps in more detail. In these steps, learning outcomes are mainly represented
60 in the skills domain, highlighting its relevance to the acquisition of EBP competencies.

1
2
3
4 Nursing research conducted in Europe has been criticized as being predominantly descriptive,
5 unnecessary, and of little relevance to clinical practice (Richards, Hanssen, & Borglin, 2018).
6 As nurses globally account for the greatest proportion of healthcare professionals, it may be
7 assumed that the expected EBP outcome of providing the best possible care at the lowest
8 possible cost in a limited-resource setting can be achieved only rarely (Closs & Cheater, 1999).
9 This will result in serious consequences for quality of care, as well as for patient safety and
10 outcomes (Saunders, & Vehviläinen-Julkunen, 2016). Changes in healthcare mean there is an
11 urgent need to educate nurses to be competent in EBP. Changes in practice must be reflected
12 by changes in education (Oh et al., 2010).

13
14 Our study also indicated that EBP teaching varies between countries, and that knowledge of
15 EBP is integrated into bachelor's and master's study programs in different ways. EBP content
16 is mainly included as part of subjects that incorporate only certain of its concepts, or as a stand-
17 alone course (Skela-Savič et al., 2020). Healthcare facilities, together with education providers,
18 face the challenge of finding the most effective way of training and further educating nurses in
19 EBP. One of the sign of effectiveness of university courses is that upon completing EBP
20 courses, students are able to apply their EBP skills (Zeleníková et al., 2014).

21
22 The set of competencies and learning outcomes has been adapted and developed to respond to
23 the specific learning needs of the nursing discipline. It is necessary to design new strategies for
24 teaching EBP (Aglen, 2016). The organization of EBP into affective, cognitive, and skills
25 domains, as suggested (Ramis et al., 2019), may serve as guidance for developing and
26 harmonizing the content of teaching and teaching principles, and strategies that may improve
27 EBP competencies in nurses.
28
29

30 **Study limitation and future research**

31
32 The heterogeneity and differences in development between nursing levels in EBP across
33 European countries has not facilitated differentiation between competencies and learning
34 outcomes for general and advanced nurses. Experts from Finland found that some of Melnyk's
35 competencies for general nurses required the knowledge and skills of advanced nurses
36 (Saunders, Gallagher-Ford, & Vehviläinen-Julkunen, 2019). This implies the need for future
37 research, perhaps first at national levels, to achieve consensus and to define the competency
38 level of EBP for general and advanced nurses in Europe, and to develop a common framework
39 to facilitate curriculum development and continuing education.
40
41

42 **Linking evidence to action**

- 43 - The set of EBP competencies and learning outcomes can guide nurse educators, managers,
44 and EBP stakeholders in the development of contents that incorporate EBP knowledge, skills,
45 and attitudes into education programmes.
- 46 - Prioritizing the EBP competencies and learning outcomes that are most necessary, and
47 adapting them to every context, will provide healthcare organizations with guidelines for
48 enhancing the continuing education of nurses.
- 49 - These results could facilitate the development of effective tools for assessing nursing students'
50 and nurses' perception of competencies required for EBP processes.
51
52

53 **Conclusions**

54
55 Based on a literature review and expert consensus, a set of core EBP competencies for nurses
56 and the most important EBP learning outcomes was developed for implementation into nursing
57 education programs across European countries.
58

59 **Acknowledgements**

We would like to express our gratitude to all experts who participated in the Delphi survey.

EBP E-TOOLKIT ERASMUS+

Providing a Teaching and Learning Open and Innovative Toolkit for Evidence-based Practice to Nursing European Curriculum

DATA EXTRACTION PROTOCOL**Activity dates:****Start 2nd January 2019****End 28th of February 2019****Title of review**

Definition EBP competencies for general and advanced nurses.

Objective

Identify and analyze studies focusing on EBP competencies for general and advanced nurses.

Review questions

What are core EBP competencies for general and advanced nurses?

Keywords in alphabetical order

Competence; Curriculum; Evidence-based Practice; Evidence-based Nursing, Learning; Nurse; Nursing Degree; Skills; Nurse

Research limits

<i>Language</i>	English and languages of the participants (Spanish, Polish, Italian, Greek, Slovenian and Czech)
<i>Year of publication</i>	1998-2018
<i>Type of documents</i>	Observational, quasi-experimental and experimental studies, reviews, reports and guidelines.

Selection criteria

<i>Inclusion criteria</i>	Studies focusing on EBP competencies for nurses and other health care professionals. Note: We must collect the competencies separately nurses, and other health care professionals. Many of this competencies are common with other HC professionals.
<i>Exclusion criteria</i>	Not at this moment (maybe we could include any criteria after the review)

Core bibliographic databases

<i>International databases</i>	CINAHL Plus with Full Text
	SpringerLink
	Cochrane Library
	ProQuest
	ScienceDirect
	Web of Knowledge
	SCOPUS
	EBSCO
	PubMed
	EMBASE
	PsycINFO
	others (each team could add other international Databases that they will use in their searches)
<i>National databases</i>	bibliographic databases of Spanish, Polish, Italian, Greek, Slovenian and Czech
<i>Other resources</i>	Associations, Institutions Webpages Books, Thesis

Search operator

Boolean operators - binary operator (AND, OR).

Search terms

1.	(evidence-based practice OR evidence-based nursing OR EBP OR EBN) AND (competence OR skills) AND nurse
2.	(evidence-based practice OR evidence-based nursing OR EBP OR EBN) AND curriculum AND nursing degree AND (learning OR teaching)

EBP E-TOOLKIT ERASMUS+

Providing a Teaching and Learning Open and Innovative Toolkit for Evidence-based Practice to Nursing European Curriculum

Data storage

For data storage use Mendeley. That will permit to storage and share the records.

You can download the app for your computer from www.mendelay.com. It is free and you can create a desk version that is very easy to manage.

Data extraction

For data extraction use PRISMA Flow Diagram.

(<http://prisma-statement.org/prismastatement/flowdiagram.aspx>)

Data evaluation

Analysis of selected data

Description of the records in a table showing the next information (Enter in DRIVE and include your Data into the file “Competences on EBP Systematic Review”. Each team has to use their own country sheet): Complete reference, Language, Type of document, author, year of publication, title, type of study, geographical location, objectives, methods, measure, sample, results, set of competences specifically for nurses and set of competences for other healthcare professions, conclusion.

Final Report

Set of competences

Final report including a set of competences selected after the review. It is important to include a list of the competences in English. Avoid to duplicate competences.
Note: We must collect the competencies separately nurses, and other health care professionals. Many of this competencies are common with other HC professionals.

ANNEX I

You have to indicate the next information regarding your search. Repeat this annex for each database where you search:

1.- Database name

2.- Search date

3.- Searching terms used. (At the protocol we have the English searching terms but maybe this is not adequate for your own language database, and you have to modify in anyway the terms. No problem but always we have to clarify the searching terms).

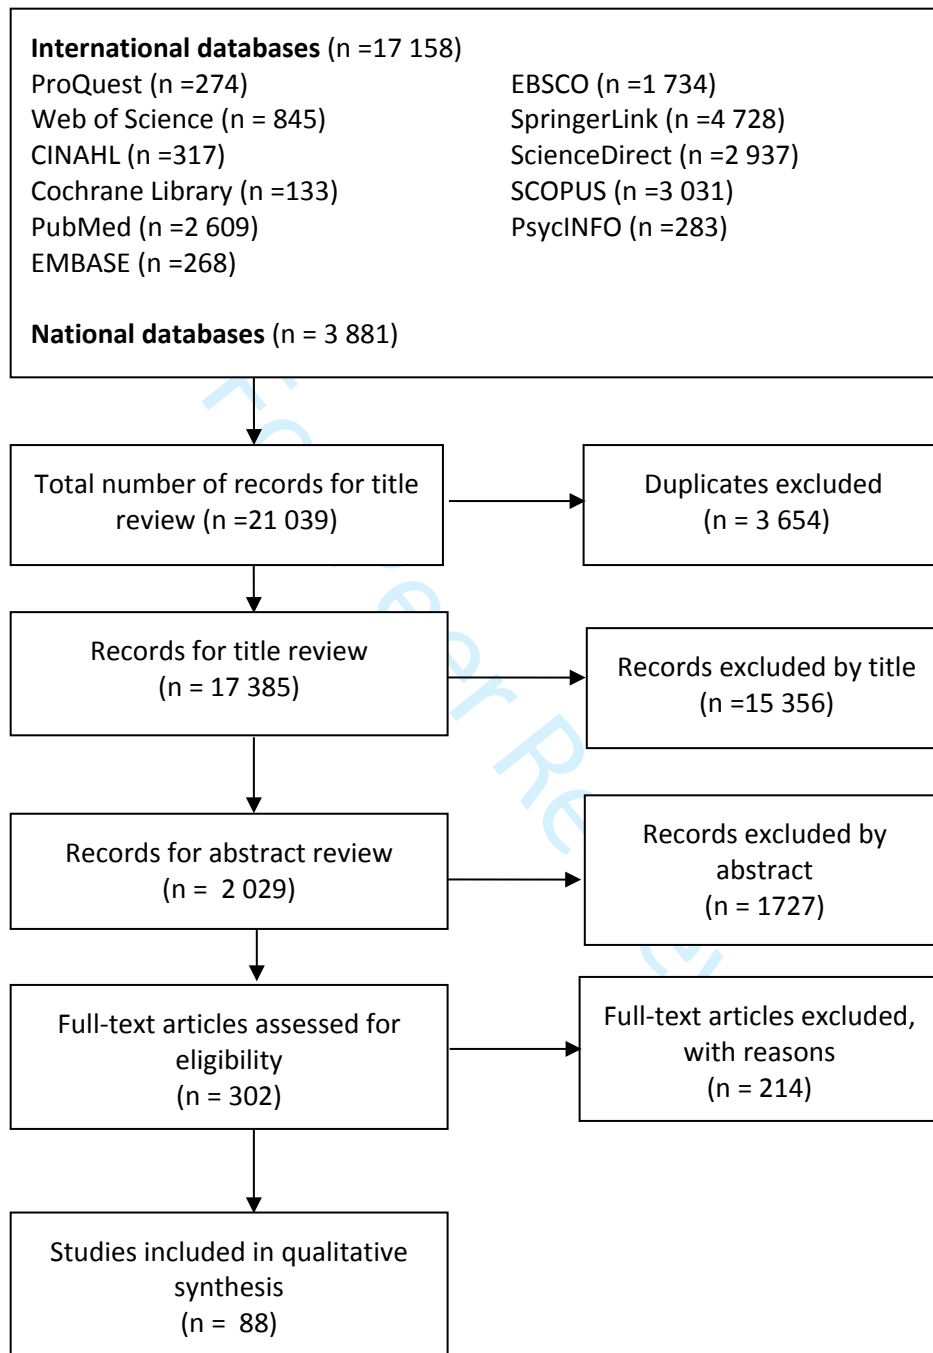

4.- Limits included if is appropriated.

5.- Results (number of registers)

6.- Selected registers (after read the title and abstract we have to indicate the number of registers that we are going to select for reading full text).

Finally, we have to extract the data of the selected register at the excel that you will find in DRIVE and include your Data into the file “Competences on EBP Systematic Review”. Each team has to use their own country sheet.

Supplement 4 Sequence of selection and distribution of statements along the 3 phases of the study

Phase 1			
	Initial set of competencies n (%)	Excluded statements n (%)	Output Phase 1 n (%)
Step 0	79 (9.4)	14 (9.9)	65 (9.6)
Step 1	81 (9.7)	24 (15.2)	57 (8.4)
Step 2	170 (20.3)	46 (29.3)	124 (18.3)
Step 3	214 (25.6)	23 (1.4)	191 (28.2)
Step 4	132 (15.8)	8 (5.1)	124 (18.3)
Step 5	69 (8.2)	4 (2.5)	65 (9.6)
Step 6	56 (6.7)	4 (2.5)	52 (7.7)
Without allocation	34 (4.0)	34 (21.6)	0 (0)
Total	835 (100)	157 (100)	678 (100)

Phase 2 / Round 1				Phase 2 / Round 2		
	Output Phase 1 n (%)	Excluded statements n (%)	Output Round 1 n (%)	Output Round 1 n (%)	Excluded or added statements (n)	Output Total n (competencies-learning outcomes)
Step 0	65 (9.6)	39 (8)	26 (13.8)	Step 0	26 (13.8)	23 (5-18)
Step 1	57 (8.4)	40 (8.2)	17 (9.0)	Step 1	17 (9.0)	11 (1-10)
Step 2	124 (18.3)	92 (18.8)	32 (17.0)	Step 2	32 (17.0)	19 (2-17)
Step 3	191 (28.2)	156 (31.8)	35 (18.6)	Step 3	35 (18.6)	23 (4-19)
Step 4	124 (18.3)	89 (18.2)	35 (18.6)	Step 4	35 (18.6)	26 (4-22)
Step 5	65 (9.6)	42 8.6)	23 (12.2)	Step 5	23 (12.2)	21 (4-17)
Step 6	52 (7.7)	32 (6.5)	20 (10.6)	Step 6	20 (10.6)	21 (4-17)
Total	678 (100)	490 (100)	188 (100)	Total	188 (100)	144 (24-120)

Phase 3					
Step	Competencies	Learning Outcomes			Σ
		Affective domain	Cognitive domain	Skills domain	
Step 0	5	5	6	7	18
Step 1	1	2	3	5	10
Step 2	2	1	7	9	17
Step 3	4	2	9	8	19
Step 4	4	5	2	15	22
Step 5	4	2	5	10	17
Step 6	4	3	4	10	17
Total	24	22	35	63	120

Supplement 6 Set of core EBP competencies and relevant learning outcomes for general and advanced nurses

STEP 0. CULTIVATE A SPIRIT OF INQUIRY WITHIN AN EBP CULTURE AND ENVIRONMENT		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Questions clinical practices for the purpose of improving the quality of care. • Describes clinical problems using internal evidence (evidence generated internally within a clinical setting, such as patient assessment data, outcomes management, and quality improvement data). • Participates to establish and sustain an evidence-based practice culture. • Mentors others in evidence-based decision making and the EPB process. • Implements strategies to establish and sustain an EBP culture. 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Assumes the role of a change agent for the organization. • Believes that EBP results are the best clinical care for patients. • Fosters EBP organizational culture, infrastructure, and teamwork. • Supports a culture of inquiry. • Understand the impact of the clinical practice questioning on improving individual/group health outcomes.
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Describes ethical principles related to variation in practice and EBP. • Explains the purpose and importance of EBP in clinical practice. • Explains the significance of practice variation related to evidence-based care. • Justifies that 7 steps of EBP help to make decisions in clinical practice. • Defines EBP as the integration of the best research evidence with clinical expertise and the patient's unique values and circumstances. • Understands the distinction between using research to inform a clinical decision-making vs conducting research.
	<i>Skills domain</i>	<ul style="list-style-type: none"> • Identifies gaps in the clinical practice. • Identifies the need for change based on evidence. • Acts as a resource on current, rapidly advancing evidence-based quality initiatives and change forces. • Addresses clinical problems and quality improvement issues with the evidence-based practice process. • Participates in the organizational culture of evidence-based quality improvement in care. • Provides leadership for integrating EBP in clinical practice. • Facilitates movement of practice change through formal institutional channels collaborating with stakeholders and resource managers.
STEP 1. ASK THE BURNING CLINICAL QUESTION IN THE FORMAT THAT WILL YIELD THE MOST RELEVANT AND BEST EVIDENCE (I.E., PICOT FORMAT)		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Converts a clinical problem into an answerable, clinical question using a structured format (i.e.: 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Recognizes the relevance of meaningful clinical questions to address clinical practice. • Keeps an open mind to be an inquiry about the clinical practice.

PICO(T) or others).	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Differentiates the key components of a structured, clinical question (PICO(T) format or others). • Explains the difference between the types of questions that cannot typically be answered by research (background questions) and those that can (foreground questions). • Identifies different types of clinical questions, such as questions about treatment, diagnosis, prognosis, etiology, and meaning.
	<i>Skills domain</i>	<ul style="list-style-type: none"> • Formulates a structured question in response to clinical query/issue. • Classifies the major study designs for each type of clinical question. • Identifies clinical problems that can be addressed through evidence-based practice. • Uses frequency and relevance criteria to prioritize clinical questions. • Uses generic accepted terminology in creating a structured, clinical question.
STEP 2. SEARCH FOR AND COLLECT THE MOST RELEVANT AND BEST EVIDENCE TO ANSWER THE CLINICAL QUESTION (E.G., SEARCHING FOR SYSTEMATIC REVIEWS, INCLUDING META-ANALYSES)		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Searches for external evidence (evidence generated from research) to answer focused clinical questions. • Systematically conducts an exhaustive search for external evidence to answer a clinical question 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Is aware that it is necessary to screen and select the appropriate information to answer a clinical question.
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Recognizes major document types and resources included on principal bibliographic databases. • Classifies scientific evidence as primary research evidence, synthesis (systematic reviews) and evidence summary. • Describes the hierarchy search of a clinical question. • Describes the principal health sciences and allied sciences bibliographic databases/resources to search. • Details the search strategies (controls vocabulary, thesaurus, keywords, limit function, and Boolean operators). • Distinguishes scientific evidence as primary research evidence and preappraised literature (systematic reviews, clinical practice guidelines, evidence summaries,...) • Distinguishes between filtered (pre-appraised) and unfiltered (un-appraised) database resources and recognizes the common databases in use (e.g. Medline, CINAHL,...)
	<i>Skills domain</i>	<ul style="list-style-type: none"> • Conducts a systematic approach to search for evidence in appropriate databases (i.e., development of synonyms from the PICO question and correct use of Boolean operators per the database in a search). • Searches the literature on electronic databases and online repositories. • Constructs an appropriate search strategy for answering clinical questions. • Reviews and select the appropriate evidence after reading the title and abstract. • Demonstrates computer searching skills.

		<ul style="list-style-type: none"> • Obtains the full text of articles and other evidence resources. • Understands the evidence written in English. • Uses available supports (healthcare librarians) that help her/him find the evidence to answer their clinical question. • Employs bibliographic databases tools (i.e. history, related articles, etc.).
STEP 3. CRITICALLY APPRAISE THE EVIDENCE THAT HAS BEEN COLLECTED FOR ITS VALIDITY, RELIABILITY, AND APPLICABILITY THEN SYNTHESIZE THAT EVIDENCE		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Critically appraises preappraised evidence (such as clinical practice guidelines, evidence-based policies and procedures, and evidence syntheses). • Critically appraises published research studies to determine their strength and applicability to clinical practice. • Evaluates and synthesizes a body of evidence gathered to determine its strength and applicability to clinical practice. • Leads a team to synthesize the evidence from primary research and preappraised evidence. 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Encourages to evaluate clinical practice guidelines and other evidence for applicability and feasibility in practice. • Appreciates the practical utility of research findings.
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Distinguishes the importance of the difference between evidence-based documents and opinion-based documents. • Describes the different quality level of the designs of the investigation studies. • Explains the principal measures of association and the potential impact that allow evaluating the magnitude of the analyzed effect in investigation studies. • Explains the purpose and processes of a qualitative study • Identifies key criteria in any evidence reports using critical appraisal checklists. • Identifies the strengths and limitations of various types of research studies (quantitative and qualitative). • Identifies the biases in the principal investigation designs and the impact of these on the results. • Lists of advantages of pre-appraisal documents as a strong evidential foundation for clinical decision making. • Recognizes how qualitative research can inform the decision-making process.
	<i>Skills domain</i>	<ul style="list-style-type: none"> • Participates in institutional initiatives for evaluation and synthesis of a body of evidence gathered to determine its strength and applicability to clinical practice. • Assesses reliability, validity, and limitations of the research evidence. • Distinguishes the difference between clinical importance vs statistical significance. • Creates or participates on teams oriented to synthesize evidence. • Grades the research studies result in the following level of evidence (quality) and grades (strength) of recommendation. • Interprets different types of measures of association and effect, including key graphical presentations and confidence intervals. • Uses relevant appraisal tools to evaluate the evidence. • Interprets the grading of the certainty in evidence and the strength of recommendations.

STEP 4. INTEGRATE THE EVIDENCE WITH ONE’S CLINICAL EXPERTISE AND THE PATIENT’S PREFERENCES AND VALUES TO IMPLEMENT A CLINICAL DECISION		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> Collects practice data (e.g., individual patient data, quality improvement data) systematically as internal evidence for clinical decision making in the care of individuals, groups, and populations. Integrates evidence gathered from external and internal sources in order to plan nursing care. Implements practice changes based on evidence and clinical expertise and patient preferences to improve care processes and patient outcomes. Leads transdisciplinary teams in applying synthesized evidence and internal evidence to initiate clinical decisions and practice changes to improve the health of individuals, groups, and populations. 	<i>Affective domain</i>	<ul style="list-style-type: none"> Chooses evidence-based approaches over routine as a base for own clinical decision making. Considers the patients’ preferences and values when designing interventions or protocol changes. Promotes the delivery of care on the unit(s) or clinic(s) aligns with evidence-based practice recommendations. Promotes practice changes based on evidence and clinical expertise and patient preferences to improve care processes and patient outcomes. Purposes modifications at the workplace/organization to implement.
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> Describes potential barriers and supports to knowledge translation and strategies to overcome these. Identifies the components of the change process using a planned change model.
	<i>Skills domain</i>	<ul style="list-style-type: none"> Interviews individuals, families to identify patient health status. Adapts synthesized knowledge and recommendations from clinical practice guidelines to accommodate local clients, populations, and settings. Creates or participates in an implementation plan for incorporating the consideration of best evidence into clinical practice. Engages patients in the decision-making process, using shared decision making, including explaining the evidence and integrating their preferences. Creates strategies for supporting colleagues to implement practice changes. Uses a comprehensive set of relevant variables within and across the system to measure the quality of care. Uses organisational information (policies / guidelines, etc.) to change practice. Changes clinical practice using guidelines/ evidence-based protocols. Changes the clinical practice based on patient assessment data. Uses organizational quality indicators to identify health needs in patients. Delivers care using evidence-based CPGs and another types of evidence. Explains evidence and discusses options with the patient in lay language. Updates nursing guidelines/standards/rules. Leads or participates the team to develop evidence-based practice recommendations for unit(s), clinic(s), and/ or organization. Manages or participates an interdisciplinary team for implementing practice changes.
STEP 5. EVALUATE OUTCOMES OF THE PRACTICE DECISION OR CHANGE BASED ON EVIDENCE		

Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Interprets obtained outcomes after the evaluation of an evidence-based changed practice. • Measures processes and outcomes of evidence-based clinical decisions. • Generates internal evidence (evidence generated internally within a clinical setting, such as patient assessment data, outcomes management, and quality improvement data) through outcomes management and EBP implementation projects to integrate best practices. • Evaluates outcomes of evidence-based decisions and practice changes for individuals, groups, and populations to determine best practices. 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Recognizes the need to evaluate the impact on outcomes. • Recognizes the importance of facilitating the evaluation (register) for the EBP.
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Describes an evaluation plan to analyze the changes produced. • Identifies data and indicators to evaluate services for individuals, families, and groups. • Identifies a strategy for direct measures of care outcomes, e.g. derived from clinical documentation, case review, patient's feedback. • Relates cost outcomes and patient benefits. • Describes specifically safety and quality outcomes of nursing care.
	<i>Skills domain</i>	<ul style="list-style-type: none"> • Interprets analysis of indicators/outcomes in terms of quality of care. • Assesses the effectiveness of the interventions to determine improvement in patients or practice. • Changes practice based on patient outcome data. • Collects practice data (e.g., individual patient data, quality improvement data) systematically for clinical decision making in the care of individuals, groups, and populations. • Manages the interdisciplinary team for outcomes evaluation. • Evaluates the application of interventions and identify areas for improvement. • Implements processes to monitor and evaluate the impact of practice change (individual, service, and organization). • Participates in evidence-based quality improvement processes to evaluate outcomes of practice changes. • Participates in the review of practice outcomes, standards, and guidelines; review of policies, procedures, and guidelines based on evidence. • Uses audit and feedback of data as an implementation strategy to promote the use of the evidence-based practice in the unit(s) or clinic(s).
STEP 6. DISSEMINATE THE OUTCOMES OF THE EBP DECISION OR CHANGE		
Competencies	Learning outcomes related to EBP competency for nursing roles	
<ul style="list-style-type: none"> • Disseminates best practices supported by evidence to improve quality of care and patient outcomes. • Formulates evidence-based policies and procedures. • Leads or participates in the generation of external evidence with other healthcare professionals. 	<i>Affective domain</i>	<ul style="list-style-type: none"> • Performs activities to disseminates EBP. • Believes in the importance related to communicate and share results of practice changes to colleagues, patients, and stakeholders. • Encourages experience sharing to emphasize the need for change and positive outcomes of change
	<i>Cognitive domain</i>	<ul style="list-style-type: none"> • Defines a variety of methods to disseminate results of practice changes tailored to communities/populations. • Describes ethical, legal and policy guidelines in the dissemination of data and information.

<ul style="list-style-type: none"> Communicates best evidence to individuals, groups, colleagues, and policy makers. 		<ul style="list-style-type: none"> Identifies the principal sections of scientific communication (oral and poster presentations, papers, etc.). Lists peer-reviewed journals and national-level meetings for dissemination of evidence-based practice outcomes.
	<i>Skills domain</i>	<ul style="list-style-type: none"> Creates strategies for dissemination of evidence-based practice into the health care environment. Prepares (or participates on) academic writings for results dissemination. Synthesises (or participates on) the results of practice change in an understandable way. Shares (or participates on) structural, process and patient outcomes from an EBP implementation project. Gives feedback regarding patient outcomes and achieves to colleagues in a constructive way. Utilizes the information and communications technology in sharing results of practice changes. Adapts (or participates on) the communication of obtained outcomes to the different audiences (patients, colleagues, policy makers) and/or media and audiences. Demonstrates public speaking and active listening skills. Leads or participates in interdisciplinary teams, including patients and professional associations to the dissemination of outcomes. Discusses implications of research with colleagues.
